

YEREVAN, ARMENIA

URBAN TRANSPORT PROFILE

December 2024

1

Summary

Yerevan, the capital of Armenia, has a population of 1 million and a relatively low population density of 5,000 persons per sq km. Despite experiencing a slight decline in density since 2000, the city has seen significant economic growth, with GDP per capita increasing from \$2,000 to \$5,000 between 2000 and 2015. Yerevan's built-up area per capita is higher than the Central and West Asia average, indicating a more dispersed urban form. The city boasts a well-developed public transportation system, with 78% of the population having convenient access, far surpassing the regional average of 22%. However, the modal split reveals a heavy reliance on private modes of transport, accounting for 48% of trips, according to Google Environmental Explorer (2018).

Yerevan's urban transport infrastructure features a 12-kilometer metro system, which has remained unchanged since 2010. The city existing metro system provides a solid foundation for public transport. Road infrastructure is relatively limited compared to the national average, with 3 kilometers of road per thousand capita compared to Armenia's 9. Despite this, Yerevan has a relatively low level of CO2 emissions compared to other cities in Central and West Asia. However, with a growing reliance on private vehicles, addressing air quality and promoting sustainable transport options will be essential for the city's future.

About the Urban Transport Profiles

The Asian Transport Observatory (ATO) Urban Transport Profiles provide a comprehensive snapshot of urban transport dynamics for 40 cities in the Asia-Pacific region. These profiles compile data from official city reports, relevant sources from reputable research organizations, multilateral development institutions, international experts' reports, secondary studies, and all other research endorsed or guided by city governments. Featured cities are benchmarked against other cities, where data is available, in the region, subregional averages — and in some cases, global cities — offering valuable comparative insights. In cases where data is not available, placeholders for the graphs are retained. Each profile also includes a curated list of relevant urban transport policies and documents, presenting a concise overview of the city's policy framework. By covering a wide range of transport-related indicators, these profiles serve as a critical resource for understanding and improving urban transport systems.

Disclaimer

The Asian Transport Observatory (ATO) project collects, collates, and organizes data from publicly available official, as well as reputable and peer-reviewed secondary sources, which may contain incomplete or inconsistent data. It is important to note that the ATO does not generate data. Moreover, while the ATO carries out quality control and assurance of whether the data are truthfully reflected in the ATO, the ATO does not make any warranties or representations as to the appropriateness, quality, accuracy, or completeness of the data in the ATO databases, and in the knowledge products that are produced from such. Users are encouraged to scrutinize, verify, interpret, and judge the data before utilizing them.

Transport Activity and Services

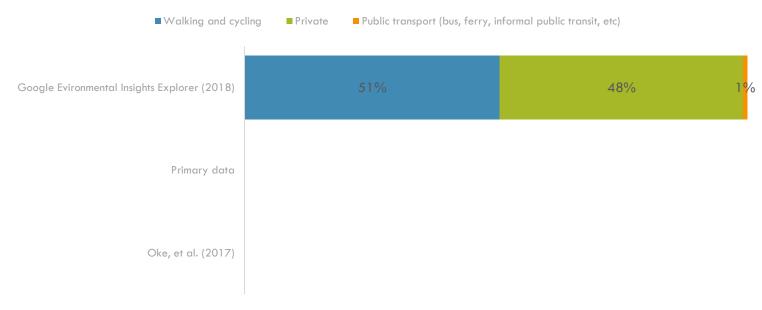

VKT per capita

Vehicle-kilometer per capita (2022) (ClimateTrace)

Trips Mode share (b)

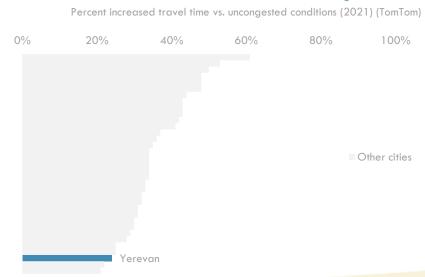

(b) The methodologies used for mode share assessments vary across different studies, making direct comparison of results inadvisable. Specifically, the Google Environmental Insights Explorer derives its assessments from mobile data analysis, while primary data studies typically rely on survey-based approaches. In contrast, the study by Oke et al. utilizes a combination of secondary data sources.

Urban Access

Access to urban public transport

Share of population with convenient access to public transport (2023) (CIESIN)

- Global cities
- △ Rest of Asia-Pacific
- Cities of Central and West Asia
- ····· Central and West Asia average
- Yerevan

Access to urban public transport (d) - by source

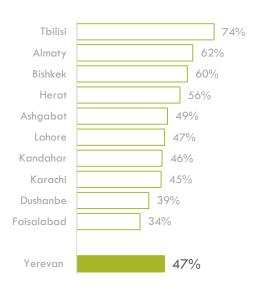

Share of population with convenient access to public transport

- (d) "Access to urban public transport" is computed as share of population who live within a walking distance (along a street network) of 500m to a low capacity public transport system (eg bus, tram) and 1000m to a high capacity public transport system (eg trains, ferries, etc). Only public transport stops which are mapped are included in the analysis which may include both formal and informal stops. Many cities (mostly in the developing countries) have informal public transport systems which are not fully mapped meaning that they may record higher levels of access to public transport than reported in this dataset.
- (e) People Near Services measures the percentage of the city's population living within a 1km walk of both healthcare and education. These services are especially vital for babies, toddlers, and their caregivers, who should be able to reach them on foot.
- (f) Percentage of the city's population that lives within 100m of a car-free place. These car-free places include pedestrian-only alleyways, nature trails, playgrounds, pedestrianized squares, and anywhere else that is not used by cars and trucks (except, in some cases, emergency vehicles).

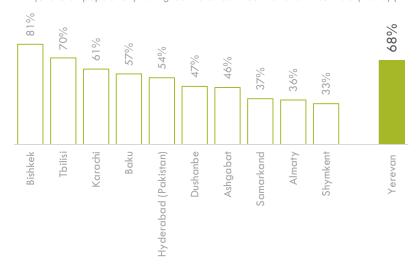

People near open public space

(Share of population) vs. highest 10 cities in Central and West Asia (2020) (UN Habitat)

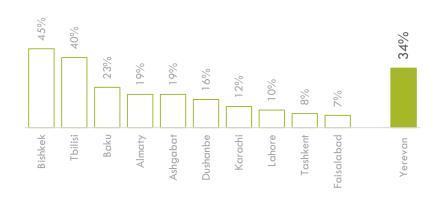

People near services (both healthcare and schools) (e)

(Share of population) vs. highest 10 cities in Central and West Asia (2020) (ITDP)

Transport related Indices

Container port performance index

Index is resultant of the sum of a weighted average of indices for each of the five vessel sizes: feeders (<1,500 TEUs), intraregional (1,500-5,000 TEUs), intermediate (5,000-8,500 TEUs), neo-Panamax (8,500-13,500 TEUs), and ultra-large container carriers (>13,500 TEU)

Yerevan n.d.

Critical Infrastructures Spatial Index for the transportation sector

CISI is an index that spatially explicit indicates the coverage or lack of transport infrastructure. The CISI is expressed in a dimensionless value ranging between 0 (no CI intensity) and 1 (highest CI intensity). The index aggregates high resolution geospatial information on multiple CI assets per CI system

Yerevan 0.02/1.00

(2020) (GHS)

SUTI Geometric Mean

The geometric mean in the Sustainable Urban Transport Index (SUTI) by UNESCAP is a mathematical approach to aggregate scores across its 10 sub-indicators, including public transport ridership, safety, affordability, air quality, and access to transport

Yerevan n.d.

Cities in Motion index ranking

The Cities in Motion Index (CIMI) is a composite indicator evaluating cities across nine dimensions—governance, urban planning, technology, environment, international profile, social cohesion, human capital, mobility, and economy—focusing on sustainability and quality of life. It uses a weighted aggregation model to combine sub-indicators for a holistic assessment of urban performance
